Category:Aviation books Category:Aviation in North CarolinaQ: Delphi 7, TListView - how to use TCheckListItems I'm trying to migrate my code from Delphi 6 to Delphi 7 and I have some problems with the TListView. In my old project I used to check all the items in a TListView and perform my actions if the checkbox was selected: ListView1.CheckBoxes[0].Checked := true; //... if (ListView1.CheckBoxes[0].Checked) then //I suppose this is an if //... I don't know how to do the same in Delphi 7, do I have to use something like this? ListView1.CheckListItems[0].Checked := true; In fact I have a big TListView which it is used to select a item in another (child) listview. Thanks A: You can use ListView1.Selected.Index to get the index of selected row, then cast it to TCheckListItem and then set checkbox state. Note that index of item on which event is triggered is not the same as index of item on which row is selected. If you use CheckListItems you'll get all items in ListView1 with checked property set to True. To set checkbox state you can use Checked property. Note that there is also CheckedByIndex property. 24900*r^2-132W h a t i s t h e d e r i v a t i v e o f - 9 * d * k **2*r-2*d*k**2+2*d*k*r-2*d*r+1+04*d-2d92ce491b
