A bidirectional photovoltaic power plant (BPVPP) has been constructed and tested for hospital energy utilization. This consists of two photovoltaic power stations (BPVPS), which generate electricity from solar radiation during morning and evening peak hours and feed electricity to a hospital building during non-peak hours and full loads. The goal of this paper is to analyze the performance of the BPVPP with different power loads and determine its potential for building energy conservation, reduce peak power loads and cost. The system results in a generation of 34.9 kW during morning peak and 46.3 kW during evening peak and an electricity storage capacity of 11.33 kWh at a voltage of 12.5 V and a power of 24 kW. It is noteworthy to note that the proposed BPVPP shows good performance under different power loads and in general it can be utilized to provide electricity for all non-peak hours and all loads of a building. Part Three My last installment dealt with the search for a lost father and the legacy of Soviet war heroes. My new installment deals with the war at Tsagatsgutl from the perspective of the war's youngest participant, Adolph Hitler. Adolph Hitler in Tsagatsgutl. Adolph Hitler.
