inside IntelliJ Ultimate? I'm using IntelliJ Ultimate
3.5.1 and Ruby 2.0.0p195 (Ruby on Rails 4.0). I
have some Ruby files in my project (the Rails app)
that I'd like to run in the IDE. When I try to run a
class or a method, the IDE complains that there is
no run configuration for the file. Also, the Ruby
interpreter (IRB) complains about not finding the
gems, even though they are included by default.
Some solutions I found are: I can open the built-in
Terminal window and run my files there. I can run
the project as a groovy or java application. This is
a rather annoying workflow, especially since I had
to disable the built-in Terminal integration to
avoid this issue, and for the same reason it seems
it is not possible to open and run Ruby files in the
built-in Ruby/Groovy console. A: With the Groovy
plugin in IntelliJ, you can create a Run/Debug
configuration for any (groovy) file that's in your
project. Open the Run/Debug configurations dialog
(Cmd + Shift + F10) Select "Create Groovy
configuration..." Click "Create a Groovy
Configuration..." and fill in the following

and Set Based on Specific Hour I am trying to

figure out how to make an expireDate be based
on a specific hour, similar to this JSFiddle: How

can I make the 12th hour be today's hour plus 1
minute, 13th hour to be to day's hour plus 1

minute, etc.? Thanks! var today =

moment().startOf('day');

today.add(1,'m').startOf('hour').utc(); // 12:01am

var expireDate = today.add(1,'m'); expireDate =

today.add(1,'m').utc(); A: You can use startOf for

this. const day1 =

moment().startOf('day').add(1,'m'); const day2 =

moment().startOf('day').add(2,'m'); //here get

current hour const currentHour =

moment().startOf('hour'); //var expireDate =

day1.startOf('hour').add(1,'m') // .add(1,'m').utc();

//var expireDate = day2.startOf('hour').add(1,'m')

// .add(1,'m').utc(); console.log(day1) // 12:01:00

console.log(day2) // 13:01:00 As you can see in

the example the second time, you will have

tomorrow's hour. 648931e174

The term is also used to describe a smaller amount (approximately 1/4 of 1 chōme or 0.25/0.5 of 1 kōban) of real estate; this can be loosely translated as a mere "sham home" as a substitute for a real house in a more practical sense. Kojiji are encountered most commonly in the business district of Chūō, Tokyo, and serve as place to seek office space, a workspace for individuals who require a more secure environment than apartments, a place to advertise a business, and a place where small-scale companies or private schools can set up a main office. There are a number of building complexes that contain many kojijis and since the 1980s and 1990s, their use has increased in Tokyo. Tier running as a Java Web App (war deployed to a Tomcat server) A client app running on a Mac App Store app (both are on OSX) These are both written in Java, and will be used by a very large number of users. I would like to design my service to be able to serialize objects, and the same code will be used by the service layer and the client layer. I've read about Serialization Frameworks such as those found here: But I am having trouble working out if they are "version aware" or not. I have a feeling I may be getting it backwards and will end up with out of date objects on the client side. My
